Problem 1b

In this lab, we used the result of a from part 1a to find the correct file we would need to analyze. Then, we loaded the file, and computed the mean, median, standard deviation, min, and max using the d-th (column 8) column given in the 'datasets.xlsx' file.

```
# load data
data <- read.csv("7/abalone.data",
                 header = FALSE)

# mean
dMean <- mean(data$V8)
sprintf(dMean, fmt = '%.3f')
```

[1] "0.239"

```
# median
dMedian <- median(data$V8)
sprintf(dMedian, fmt = '%.3f')
```

[1] "0.234"

```
# standard deviation
dSD <- sd(data$V8)
sprintf(dSD, fmt = '%.3f')
```

[1] "0.139"

```
# minimum
dMin <- min(data$V8)
sprintf(dMin, fmt = '%.3f')
```

[1] "0.002"

```
# maximum
dMax <- max(data$V8)
sprintf(dMax, fmt = '%.3f')
```

[1] "1.005"
